

ABSTRACT

An insulation inspection apparatus 10 flows a current into power lines arranged along power lines 71-80 of motors 51-60 and sequentially switches relays SA1-SA10 to
5 measure electromotive forces induced in the power lines of the DC motor, so that the insulation characteristics of the motors are inspected.

According to the insulation inspection apparatus 10, an insulation inspection apparatus, which can perform insulation inspection of a motor for a short period of time without the motor from a control device.
